

# **A Roadmap for Photovoltaic Auctions in Israel**

## **Targets and vision**

Honi Kabalo - Head of Renewable Energy, Electricity Regulatory Authority

# The evolution of Israel's Renewable Energy Scheme...

A total capacity of 3.5 GW is needed in 2020 to reach the target, comparing to ~ 1 GW installed currently

# The roadmap for 10% RES by 2020

## ❖ Installations in the existing scheme until 2020:

- ❖ Existing: ~1GW (940 MW PV, 21 MW Wind, 30 MW other)
- ❖ 180 MW of former CSP projects shifted to PV
- ❖ ~350 MW of Wind
- ❖ 400 MW of Net Metering (quota is expected to increase to 700 MW)
- ❖ 240 MW CSP Ashalim

## ❖ The rest of the gap: 2017-2018 PV Auctions (400-850 MW each year)

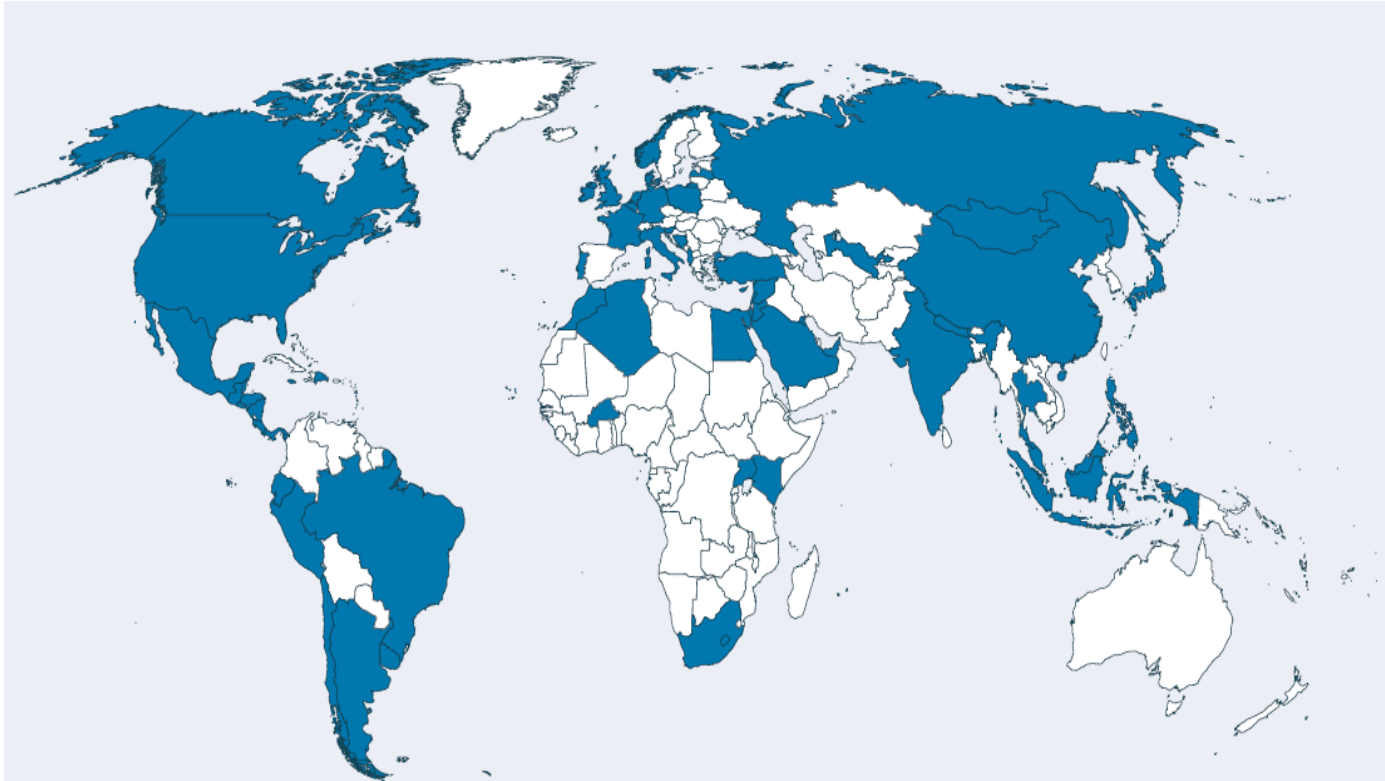

- ❖ Four auctions for Utility Scale systems connected to the distribution grid ( $x < 16$  MW)
- ❖ Two auctions for Utility Scale systems connected to the transmission grid ( $x > 16$  MW)

# PV auctions: minimum regulation

- ❖ Not only a shift in the incentive mechanism, but a shift in regulatory perspective:

Command and control: Out

Performance demands and bonds: In

Milestones

"Financial  
Closer" Approval

Licensing

Permits

Tariff, Quota,  
Binding Schedule

# Proposed principles of PV auctions

---

- ❖ Two auctions (2017-2018) for transmission system connected projects, each auction 100-250 MW
- ❖ Four auctions (2017-2018) for distribution system connected projects, each auction 150-300 MW
- ❖ An auction bid will include: tariff, quota, and bid-bond (replaced by a performance-bond later - for the auction winners)
  - ❖ **No additional requirements are needed to participate in the auction**
  - ❖ No specific project is committed by the bidder in the auction

**The bidder is committed to deliver PV projects the size of his winning bid – within the binding timetable**

# Penalties for delays in delivery

## ❖ Delay in quota delivery will result:

- ❖ A gradual bond forfeiture of the delayed quota over 60 days
- ❖ Over 60 days – the tariff guarantee for the unused quota will be canceled
- ❖ In the course of this process we expect to hear frequently the following statement: “I was delayed and it’s not my fault”

הרשות

ציבוריים  
*Men*

**No extensions, no exemptions:  
deliver the project**

**No IEC delays, no statutory difficulties, and not any other reason  
can extend the binding schedules...**

# The winner selection method: Clearing Price

---

- ❖ **The winner selection criteria: by tariff bid** (lowest bidders are declared winners up to the auctioned quota)
- ❖ All winners receive the same tariff: the tariff of the bidder under the last winning bid – that tariff is the auction's "Clearing Price"
- ❖ The above described mechanism eliminates incentive for "Strategic Bidding"...

# Clearing Price – an illustration

❖ For a 150 MW auction, the following results were received in the auction:

Bid order by tariff level	Bidder	Capacity	Auction Tariff Bid
(1)	A	30 MW	22
(2)	B	10 MW	23
(3)	C	60 MW	24
(4)	A	70 MW	25
(5)	D	50 MW	26
(6)	B	60 MW	27
(7)	C	30 MW	28
(8)	B	20 MW	29

The Winners

The Clearing Price

Bidder A wins 100 MW, bidder B 10 MW, bidder C 60 MW: all bidders receive the Clearing Price - 26

# Possible additions for future auctions: a premium system

---

- ❖ The regulator supports the promotion of policy-objectives by considering a differential system of premiums:
  - ❖ Storage
  - ❖ Rooftop installations
  - ❖ System proximity to consumption/demand
  - ❖ Location
  - ❖ Voltage
- ❖ A premium system – in contrary to a sub-quota allocation is supporting the regulator's objectives **while maintaining a high level of competition**

# What do we expect from a REmap analysis for Israel?

# External overviews of our policies improve their efficiency

- ❖ IRENA, OECD, World Bank, or any other international institution – helps us to get a clearer perspective on the effectiveness of our policies

# REmap – micro VS macro level analysis

---

- ❖ A “macro” REmap analysis – focuses on overall RES potential in the country
- ❖ A “micro” level analysis – focuses on policies, regulations, best practices
- ❖ Some critical “micro” level policy issues are currently in progress:
  - ❖ Solar auctions
  - ❖ Storage
  - ❖ The effectiveness of regulation

# Storage: how much do we need?

- ❖ An energetic island – no interconnections to other grids
- ❖ Reaching 10% of **intermittent** RES by 2020 and 17% by 2020 (no hydro, little biomass and biogas)
- ❖ Available technological alternatives?
  - ❖ Pumped storage
  - ❖ Batteries
  - ❖ Curtailment
  - ❖ Other?
